## 1/4-Duty General-Purpose LCD Driver

**ON Semiconductor®**

[www.onsemi.com](http://www.onsemi.com)

---

### Overview

The LC75836W is 1/4-duty general-purpose microprocessor-controlled LCD driver that can be used in applications such as frequency display in products with electronic tuning. In addition to being able to drive up to 140 segments directly, the LC75836W can also control up to 4 general-purpose output ports.

### Features

- 1/4 duty, 1/3 bias drive (Up to 140 segment can be displayed.)
- Serial data input supports CCB\* format communication with the system controller (support 3 V operation).
- Serial data control of the power-saving mode based backup function and the all segments forced off function.
- Serial data control of switching between the segment output port and general-purpose output port functions.
- Serial data control of the frame frequency of the common and segment output waveforms.
- Either RC oscillator operating or external clock operating mode can be selected with the serial control data.
- High generality, since display data is displayed directly without the intervention of a decoder circuit.
- The INH pin allows the display to be forced to the off state.
- RC oscillation circuit (with external resistor and capacitor)

## Serial Data Transfer Example

- When 109 or more segments are used  
All 192 bits of serial data must be sent.

- When fewer than 109 segments are used  
Either 48, 96, or 144 bits of serial data must be sent, depending on the number of segments to be used. However, the serial data shown below (the D1 to D36 display data and the control data) must always be sent.

**Control Data Functions**

1. FC0 to FC2: Common/segment output waveform frame frequency control data

These control data bits set the frame frequency of the common and segment output waveforms.

Control data			Frame frequency fo [Hz]
FC0	FC1	FC2	
1	1	0	$f_{osc}/768, f_{CK}/768$
1	1	1	$f_{osc}/576, f_{CK}/576$
0	0	0	$f_{osc}/384, f_{CK}/384$
0	0	1	$f_{osc}/288, f_{CK}/288$
0	1	0	$f_{osc}/192, f_{CK}/192$

2. P0 to P2: Segment output port/general-purpose output port switching control data

These control data bits switch the segment output port/general-purpose output port functions of the S1/P1 to S4/P4 output pins.

Control data			Output pin state			
P0	P1	P2	S1/P1	S2/P2	S3/P3	S4/P4
0	0	0	S1	S2	S3	S4
0	0	1	P1	S2	S3	S4
0	1	0	P1	P2	S3	S4
0	1	1	P1	P2	P3	S4
1	0	0	P1	P2	P3	P4

Note: Sn (n = 1 to 4): Segment output ports

Pn (n = 1 to 4): General-purpose output ports

Note that when the general-purpose output port function is selected, the correspondence between the output pins and the display data will be that shown in the table.

Output pin	Corresponding display data
S1/P1	D1
S2/P2	D5
S3/P3	D9
S4/P4	D13

For example, if the general-purpose output port function is selected for the S4/P4 output pin, that output pin will output a high level ( $V_{DD}$ ) when the display data D13 is 1, and a low level ( $V_{SS}$ ) when the D13 is 0.

3. OC: RC oscillator operating mode/external clock operating mode switching control data.

This control data bit switches the OSC pin function (either RC oscillator operating mode or external clock operating mode).

OC	OSC pin function
0	RC oscillator operating mode
1	External clock operating mode

Note: An external resistor,  $R_{osc}$ , and an external capacitor,  $C_{osc}$ , must be connected to the OSC pin if RC oscillator operating mode is selected.

4. SC: Segment on/off control data

This control data bit controls the on/off state of the segments.

SC	Display state
0	On
1	Off

Note that when the segments are turned off by setting SC to 1, the segments are turned off by outputting segment off waveforms from the segment output pins.

5. BU: Normal mode/power-saving mode control data

This control data bit selects either normal mode or power saving mode.

BU	Mode
0	Normal mode
1	Power saving mode. In RC oscillator operating mode (OC = 0), the OSC pin oscillator is stopped, and in external clock operating mode (OC = 1), acceptance of the external clock is stopped. In this mode the common and segment output pins go to the $V_{SS}$ levels. However, S1/P1 to S4/P4 output pins that are set to be general-purpose output ports by the control data P0 to P2 can be used as general-purpose output ports.

FC0	FC1	FC2	
1	1	0	$f_{osc}/768, f_{CK}/768$
1	1	1	$f_{osc}/576, f_{CK}/576$

0	0	1	$f_{osc}/288, f_{CK}/288$
0	1	0	$f_{osc}/192, f_{CK}/192$

Display Control and the  $\overline{\text{INH}}$  Pin

Since the LSI internal data (the display data D1 to D140 and the control data) is undefined when power is first applied, applications should set the  $\overline{\text{INH}}$  pin low at the same time as power is applied to turn off the display. (This sets the S1/P1 to S4/P4, S5 to S35, and COM1 to COM4 pins to the  $V_{SS}$  level.) and during this period send serial data from the controller. The controller should then set the  $\overline{\text{INH}}$  pin high after the data transfer has completed. This procedure prevents meaningless displays at power on. (See Figure 5.)

Figure 5

## Notes on Controller Transfer of Display Data

Since the LC75836W transfer the display data (D1 to D140) in four separate transfer operations, we recommend that applications make a point of completing all four data transfers within a period of less than 30ms to prevent observable degradation of display quality.

## OSC Pin Peripheral Circuit

### (1) RC oscillator operating mode (control data OC = 0)

An external resistor,  $R_{osc}$ , and an external capacitor,  $C_{osc}$ , must be connected between the OSC pin and GND if RC oscillator operating mode is selected.

### (2) External clock operating mode (control data OC = 1)

When the external clock operating mode is selected, insert a current protection resistor  $R_g$  (4.7 to 47 k $\Omega$ ) between the OSC pin and external clock output pin (external oscillator). Determine the value of the resistance according to the allowable current value at the external clock output pin. Also make sure that the waveform of the external clock is not heavily distorted.

Note: Allowable current value at external clock output pin  $> \frac{V_{DD}}{R_g}$

## Sample Application Circuit 1

1/4 Duty, 1/3 Bias (for use with normal panels)

\*2: The pins to be connected to the controller (CE, CL, DI,  $\overline{\text{INH}}$ ) can handle 3 V.

\*3: In RC oscillator operating mode, an external resistor,  $R_{\text{osc}}$ , and an external capacitor,  $C_{\text{osc}}$ , must be connected between the OSC pin and ground. If external clock operating mode is selected, a current protection resistor,  $R_g$  (4.7 to 47 k $\Omega$ ), must be inserted between the external clock output pin (on the external oscillator) and the OSC pin. (See the “OSC Pin Peripheral Circuit” section.)

\*4: When a capacitor except the recommended external capacitance ( $C_{\text{osc}} = 1000 \text{ pF}$ ) is connected to the OSC pin, it should be in the range 220 to 2200 pF.

## Sample Application Circuit 2

1/4 Duty, 1/3 Bias (for use with large panels)

\*2: The pins to be connected to the controller (CE, CL, DI,  $\overline{\text{INH}}$ ) can handle 3 V.

\*3: In RC oscillator operating mode, an external resistor,  $R_{\text{osc}}$ , and an external capacitor,  $C_{\text{osc}}$ , must be connected between the OSC pin and ground. If external clock operating mode is selected, a current protection resistor,  $R_g$  (4.7 to 47 k $\Omega$ ), must be inserted between the external clock output pin (on the external oscillator) and the OSC pin. (See the “OSC Pin Peripheral Circuit” section.)

\*4: When a capacitor except the recommended external capacitance ( $C_{\text{osc}} = 1000 \text{ pF}$ ) is connected to the OSC pin, it should be in the range 220 to 2200 pF.
