LV5234V

Bi-CMOS IC

9-channel LED Driver

Overview

The LV5234V is a 9-channel LED driver IC that is capable of switching between constant-current output and open drain output. It enables 3-wire serial bus control (address designation)/I²C serial bus control to be set arbitrarily using an external pin. Also possible are 9-channel LED ON/OFF control and the setting of the PWM luminance in 256 steps. The device also has a built-in fade-in/fade-out function. Up to 32 driver ICs can be connected using the slave address setting pins.

Function

- 9-channel output constant-current LED driver/open drain output LED driver (selected by using an external pin)
 - Supports separate ON/OFF setting for each LED output, high withstand voltage (V_{OUT}<42V)
 - In the constant-current mode (OUTSCT: L), the reference current is set by the value of resistor connected to the external pin (RT1).
 - Built-in D/A (5 bits) for switching current level ... 0.96mA to 30.7mA (RGB drive)
 - Constant current (I_O max=50mA) for full-color LEDs × 9 channels
 - In the open drain mode (OUTSCT: H), high current drive (I_O max=100mA) × 9 channels
- Luminance adjustment using internal PWM control (256 steps)
 - 8-bit PWM luminance dimming (0% to 99.6%)
 - 3-phase PWM
- Fade-in/fade-out function (PWM control priority), supporting synchronous connection
 - Supports separate fade ON/OFF for each LED output (fade time common for all channels)
 - Interrupt control possible for fade function
- Selection of 3-wire/I²C serial bus control signals enabled (switching using an external pin)
 - Slave addressing (5 bits, connection of up to 32 driver ICs possible)
- Low current consumption
- Output malfunction protection circuits (thermal protection function, UVLO detection protection function)

ORDERING INFORMATION

See detailed ordering and shipping information on page 24 of this data sheet.

LV5234V

Specifications

Absolute Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V_{CC} max		6	V
Output voltage	V_O max	LED off	42	V
Output current	I_O max		100	mA
Allowable power dissipation	P_d max	$T_a \leq 25^\circ\text{C}^*$	0.84	W
Operating temperature	T_{opr}		-25 to +75	$^\circ\text{C}$
Storage temperature	T_{stg}		-40 to +125	$^\circ\text{C}$

* Specified board : 114.3mm × 76.1mm × 1.6mm, glass epoxy board.

[Warning]: If you should intend to use this IC continuously under high temperature, high current, high voltage, or drastic temperature change, even if it is used within the range of absolute maximum ratings or operating conditions, there is a possibility of decrease reliability. Please contact us for a confirmation.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Recommended Operating Conditions at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Recommended supply voltage	V_{CC}	SV_{CC}	5.0	V
Operating supply voltage range	V_{CC} op	SV_{CC}	4.5 to 5.5	V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Electrical Characteristics at $T_a = 25^\circ\text{C}$, $V_{CC} = 5\text{V}$

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Consumption current	I_{CC2}	LED off		3.5	5.5	mA
Oscillator frequency	F_{osc}		900	1000	1100	kHz
Reference current pin voltage	V_{RT}	$RT1=22k\Omega$	0.92	0.98	1.04	V
MAX output current	ΔI_L	$V_O=0.7$ to 4.0V (Same channel line regulation)	-10			%
Between bits output current	ΔI_{OL}	$I_O=30.7\text{mA}$ (Between bits pairing characteristics)			5	%
Maximum LED driver output current 1	I_{MAX1}	LED OUTSCT= L	28.8	30.7	32.6	mA
LEDO output on resistance	R_{on1}	LED1, LED2, LED3 ($I_O = 100\text{mA}$)		4	10	Ω
OFF leak current	I_{leak}	LED off			10	μA
Driver output malfunction protection voltage	V_t	SV_{CC}	2.58	2.70	2.82	V

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

Control circuit at $T_a = 25^\circ\text{C}$, $V_{CC} = 5.0\text{V}$

Pin Descriptions

Pin No.	Pin name	I/O	Description
1	SV _{CC}	-	Power supply pin
2	SCLK	I	Serial clock signal input pin
3	SDATA	I	Serial data signal input pin
4	SDEN	I	Serial enable signal input pin
5	NC	-	No connection
6	LEDR1	O	LEDR1 output pin
7	LEDR2	O	LEDR2 output pin
8	PGND1	-	GND pin dedicated for LED driver
9	LEDR3	O	LEDR3 output pin
10	LEDG1	O	LEDG1 output pin
11	LEDG2	O	LEDG2 output pin
12	PGND2	-	GND pin dedicated for LED driver
13	LEDG3	O	LEDG3 output pin
14	A0	I	Slave address input pin A0
15	A1	I	Slave address input pin A1
16	A2	I	Slave address input pin A2
17	A3	I	Slave address input pin A3
18	A4	I	Slave address input pin A4
19	LEDB1	O	LEDB1 output pin
20	LEDB2	O	LEDB2 output pin
21	PGND3	-	GND pin dedicated for LED driver
22	LEDB3	O	LEDB3 output pin
23	CTL _{SCT}	I	3-wire serial bus/I ² C serial bus selecting control pin (L: 3-wire serial, H: I ² C)
24	SGND	-	Analog circuit GND pin
25	TEST	I	Test pin (connected to GND)
26	RESET	I	Reset signal input pin
27	RT1	O	LED current setting resistor connection pin 1
28	CT	O	Oscillation frequency setting capacitor connection pin
29	OUT _{SCT}	I	Output type switching control pin L: Constant-current output H: Open drain output
30	OSC_OUT	O	Oscillator output pin (synchronous connection)

OUT_{SCT} Settings at SV_{CC}=5.0V

	LED Driver Output Pin
OUT _{SCT} pin	LED1, LED2, LED3
L=-0.2 to 0.3V	Constant current output Built-in current value switching D/A (5 bits) 0.96mA to 30.7mA, RT1=22kΩ (f=1MHz)
H=4.7 to 5.0V	Open drain output Current value is determined by external limiting resistor. RON=4Ω

Pin Functions

Pin No.	Pin Name	Pin function	Equivalent Circuit
1	SVCC	Power supply pin	
2 3 4	SCLK SDATA SDEN	Serial clock signal input pin Serial data signal input pin Serial enable signal input pin	
14 15 16 17 18 23 29	A0 A1 A2 A3 A4 CTLST OUTSCT	Slave address setting pin A0 Slave address setting pin A1 Slave address setting pin A2 Slave address setting pin A3 Slave address setting pin A4 Serial bus communication setting pin When set to low: The 3-wire serial bus signals are set as the input signals. When set to high: The I ² C serial bus signals are set as the input signals. LED driver output type setting pin When set to low: Constant-current output is set for the LED driver. When set to high: Open drain output is set for the LED driver.	
24	SGND	GND pin	
25	TEST	Test pin This pin must always be connected to GND.	
26	RESET	Reset signal input pin Reset status when set to low.	
27	RT1	Reference current setting resistor connection pin. By connecting the external register between this pin and GND, the reference current is generated. The pin voltage is approximately 0.98V. By changing the current level, it is possible to change the oscillator frequency and LED driver current value (in the constant-current mode).

LV5234V

Continued from preceding page.

Pin No.	Pin Name	Pin function	Equivalent Circuit
28	CT	Oscillator frequency setting capacitor connection pin/oscillator input pin. By changing the value of capacitance, it is possible to change the oscillator frequency. The capacitor must be connected to this pin of the master-side IC. The CT pin of the slave-side IC must be connected as the oscillator input pin.	<p>The diagram shows two operational amplifiers configured as comparators. The non-inverting inputs (+) are connected to an internal reference voltage. The inverting inputs (-) are connected to a network of resistors and capacitors. One input is connected to the SVCC supply through a resistor and a capacitor. The other input is connected to the SVCC supply through a resistor and a capacitor, and also to ground through a resistor. The outputs of the comparators are connected to ground through resistors.</p>
30	OSC_OUT	Oscillator output pin When a multiple number of driver ICs are connected for use, the oscillators can be connected in synchronization by connecting the OSC_OUT output to the CT pin of the ICs to be connected.	<p>The diagram shows two driver ICs. Each IC has a CT pin connected to the OSC_OUT output pin. The driver ICs are shown with their internal transistors and resistors. The SVCC supply is connected to the top of the driver ICs. The outputs of the driver ICs are connected to ground through resistors.</p>

Serial Bus Communication Specifications

1) 3-wire serial bus transfer timing conditions

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Cycle time	tcy1	SCLK clock period	200	-	-	ns
Data setup time	ts0	SDEN setup time relative to the rise of SCLK	90	-	-	ns
	ts1	SDATA setup time relative to the rise of SCLK	60	-	-	ns
Data hold time	th0	SDEN hold time relative to the fall of SCLK	200	-	-	ns
	th1	SDATA hold time relative to the fall of SCLK	60	-	-	ns
Pulse width	tw1L	Low period pulse width of SCLK	90	-	-	ns
	tw1H	High period pulse width of SCLK	90	-	-	ns
	tw2L	Low period pulse width of SDEN	1	-	-	μs

Data length: 24 bits

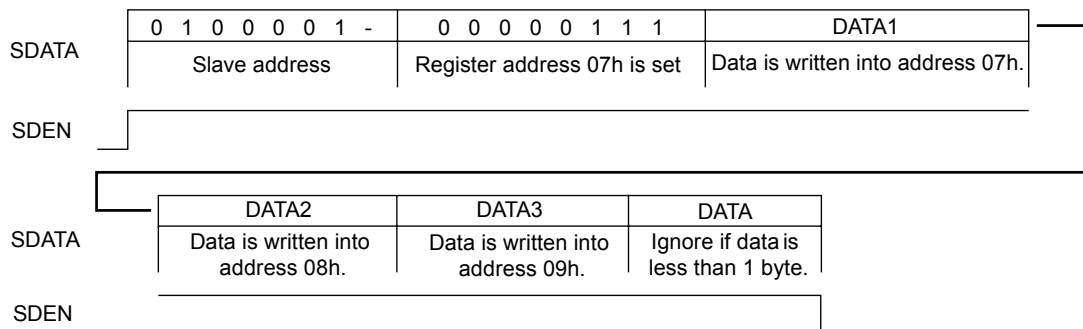

Clock frequency: 5 MHz or less

When 24 SCLK clock signals have been input during the high period of SDEN, the SDATA is taken in at the rising edge of SCLK.

Note: If the number of SCLK clock signals during the high period of SDEN is 23 or less, SDATA is not taken in. If it is 25 or more, the register address is automatically incremented every time 1 byte is taken in.

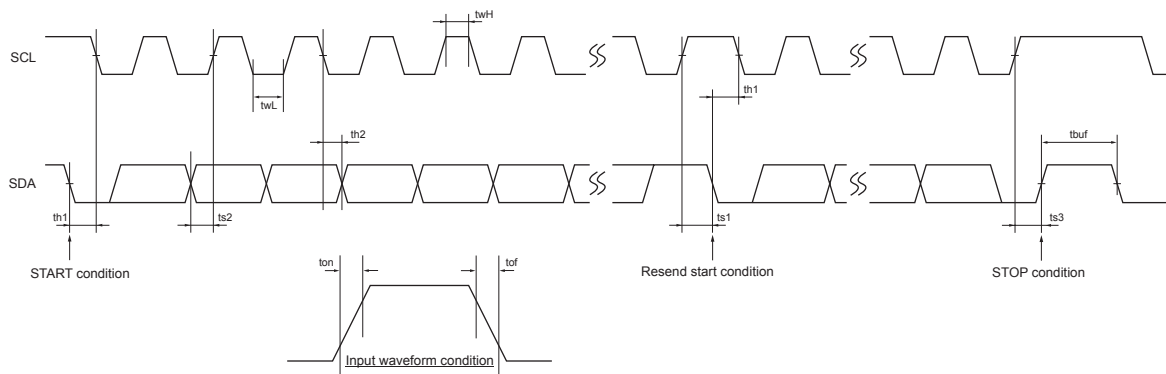

The slave address is assigned by the first byte, and the register address on the serial map is specified by the next byte. The third byte transfers the data to the address specified by the register address that was written by the second byte and if the data subsequently continues even after this, the register address is automatically incremented for the fourth and subsequent bytes. As a result, it is possible to send the data continuously from the specified addresses. Data of less than one byte is ignored. However, when the address reaches 15h, in the next byte to be transferred becomes 00h.

Example of a write operation:

LV5234V

2) I²C serial transfer timing conditions

Standard mode

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
SCL clock frequency	fsc1	SCL clock frequency	0	-	100	kHz
Data setup time	ts1	SCL setup time relative to the fall of SDA	4.7	-	-	μ s
	ts2	SDA setup time relative to the rise of SCL	250	-	-	ns
	ts3	SCL setup time relative to the rise of SDA	4.0	-	-	μ s
Data hold time	th1	SCL hold time relative to the fall of SDA	4.0	-	-	μ s
	th2	SDA hold time relative to the fall of SCL	0	-	-	μ s
Pulse width	twL	SCL pulse width for the L period	4.7	-	-	μ s
	twH	SCL pulse width for the H period	4.0	-	-	μ s
Input waveform conditions	ton	SCL and SDA (input) rise time	-	-	1000	ns
	tof	SCL and SDA (input) fall time	-	-	300	ns
Bus free time	tbuf	Time between STOP condition and START condition	4.7	-	-	μ s

High-speed mode

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
SCL clock frequency	fsc1	SCL clock frequency	0	-	400	kHz
Data setup time	ts1	SCL setup time relative to the fall of SDA	0.6	-	-	μ s
	ts2	SDA setup time relative to the rise of SCL	100	-	-	ns
	ts3	SCL setup time relative to the rise of SDA	0.6	-	-	μ s
Data hold time	th1	SCL hold time relative to the fall of SDA	0.6	-	-	μ s
	th2	SDA hold time relative to the fall of SCL	0	-	-	μ s
Pulse width	twL	SCL pulse width for the L period	1.3	-	-	μ s
	twH	SCL pulse width for the H period	0.6	-	-	μ s
Input waveform conditions	ton	SCL and SDA (input) rise time	-	-	300	ns
	tof	SCL and SDA (input) fall time	-	-	300	ns
Bus free time	tbuf	Time between STOP and START conditions	1.3	-	-	μ s

I²C bus transfer method

Start and stop conditions

During data transfer operation using the I²C bus, SDA must basically be kept in constant state while SCL is "H" as shown below.

When data is not being transferred, both SCL and SDA are set in the "H" state.

When SCL=SDA is "H," the start condition is established when SDA is changed from "H" to "L," and access is started.

When SCL is "H," the stop condition is established when SDA is changed from "L" to "H," and access is ended.

Data transfer and acknowledgement response

After the start condition has been established, the data is transferred one byte (8 bits) at a time.

Any number of bytes of data can be transferred continuously.

Each time the 8-bit data is transferred, the ACK signal is sent from the receive side to the send side. The ACK signal is issued when SDA on the send side is released and SDA on the receive side is set to "L" immediately after fall of the clock pulse at the SCL eighth bit of data transfer to "L."

When the next 1-byte transfer is left in the receive state after sending the ACK signal from the receive side, the receive side releases SDA at the fall of the SCL ninth clock.

In the I²C bus, there is no CE signal. In its place, a 7-bit slave address is assigned to each device, and the first byte of transfer is assigned to the command (R/W) representing the 7-bit address and subsequent transfer direction. Note that only write is valid in this IC. The 7-bit address is transferred sequentially starting with MSB, and the eighth bit is set to "L" which indicates a write.
